

Demo-day pre-flight checklist

Run this checklist 20 minutes before recording. All of it. Don't skip steps to "save time" — the failure modes here cost more recording time than the checks themselves.

Open this file in a tab and tick each box as you go.

1. Backend health (5 min)

Open a terminal. Run each command; expected result follows.

```
# Cloudflare Worker — should return {"ok":true,"ts":...}  
curl -s https://longtailscout.com/api/health
```

If it fails: check `npx wrangler deploy` from `E:/hack2/worker`. Don't proceed if this is broken.

```
# Bright Data bridge on .29 — should return {"ok":true,...,"browser_co  
curl -s https://bridge.longtailscout.com/health
```

If `browser_connected: false`: that's fine, it'll connect on first `/render`. **If the whole call fails:** SSH to `.29` and check `systemctl status longtail-scout-bridge`. The video will still record without it but live scouts that need JS-rendered pages will degrade.

```
# Demand index on .29 — should return JSON with a "demand" number  
curl -s "https://demand.longtailscout.com/api/research?q=roofing&tlds=
```

If it fails: SSH to `.29`, check the FastAPI service. Without this the demand probe and Niche Recon both break.

```
# MCP discovery – should list 12 tools
curl -s https://longtailscout.com/api/mcp | python -c "import sys,json
```

Expected: tools: 12 — scout, find_businesses, demand_count, operator_screenshot, draft_email, niche_recon, linkedin_check, find_contacts, account_brief, rank_triggers, signal_radar, decision_maker .

```
# The four drill-down Bright Data features (v1.2-1.7) – each should re
# These need the bridge UP. Run them so the KV cache is warm before re
for q in \
    "linkedin-check?name=Amstill%20Roofing&city=Houston" \
    "signal-radar?name=Amstill%20Roofing&city=Houston&url=https://amstil
    "decision-maker?name=Amstill%20Roofing&city=Houston" \
    "contact-discovery?url=https://amstillroofing.com&name=Amstill%20Roo
echo "==" $q =="; curl -s --max-time 90 -H "authorization: Bearer Pig
done
```

Expected: each prints JSON (checked , signals , people , Or emails). A 502 means the bridge is down — see step 1. **If you can't get the bridge up, demo these from sample mode / skip them** (see feature-guide.md → Demo modes).

2. Pre-warm the demo paths (5 min)

The demo uses two queries. Pre-warming them means they return from KV cache instead of hitting Bright Data live during recording. Saves you 30-60 seconds of dead air per take.

Run the demo scout once now so its result is cached:

```
# Burns ~$0.03 of BD/LLM, then we have a warm cache for the rest of th
curl -X POST https://longtailscout.com/api/scout \
  -H "authorization: Bearer Piglet" \
  -H "content-type: application/json" \
  -d '{"query":"roofing contractors in Houston"}' \
```

```
--max-time 90 -o /tmp/warm-scout.txt  
echo "scout done; $(wc -l < /tmp/warm-scout.txt) SSE events written"
```

Expected: prints a line count > 80. The KV cache now has this query's discovery SERP results, enriched homepages, and the synthesis output. Re-runs from any browser will hit those caches and return in 5-10s instead of 40s+.

Pre-warm Niche Recon with the demo product description:

```
curl -X POST https://longtailscout.com/api/niche-recon \  
-H "authorization: Bearer Piglet" \  
-H "content-type: application/json" \  
-d '{"product_description": "home services CRM and scheduling for tra  
--max-time 120 -o /tmp/warm-recon.txt  
echo "recon done; first niches:"; python -c "import json; d=json.load(
```

Expected: 3-5 niches print. Top niches should include plumbing, hvac, electrical with high thinness (50-100%). The cache is now warm for the recording.

If Niche Recon returns 0 niches: the demand server is overloaded. Wait 60 seconds and re-run. If it still fails, switch the demo to a different product description (try "appointment scheduling software for personal services like hair, nails, lashes, massage, brow studios").

3. Browser setup (5 min)

1. **Close every other tab and window.** Chrome should have one window with one tab.
2. **Hide bookmarks bar.** (Ctrl+Shift+B on Windows.)
3. **Disable any extensions visible in the toolbar** that might pop notifications.
4. **Open the demo URL:** <https://longtailscout.com/?key=Piglet> The ?key=Piglet will auto-unlock the demo (the SPA captures it into localStorage on first load and strips it from the URL). After the redirect the URL bar shows just `longtailscout.com`.

5. **Verify the demo is unlocked** — there should be NO yellow "Demo password required" banner. If you see one, paste `Piglet` and click Unlock.
6. **Verify the demand probe works** — type a few characters into the query input (`roo...`) and watch for the green dot + "N businesses match" message below it. If it never appears, the worker auth chain broke — re-check the URL has `?key=Piglet` .
7. **Clear the input back to empty** (or leave it on the default "roofing contractors in Houston").
8. **Browser zoom: 100%**. (`Ctrl+0` .)
9. **Devtools closed**. (`F12` to toggle if open.)

4. Recording setup

- **Resolution:** 1920×1080. Browser should be maximized but not fullscreen (you want the title bar visible).
- **Cursor visibility:** turn on "Highlight cursor" / "Show clicks" in your recorder (OBS: Settings → Sources → Display Capture. Loom: built-in.).
- **Audio:** external mic if you have one. **Test recording** 10 seconds of dead air to check ambient noise.
- **Practice run:** read the script aloud once without recording. Time it. Target is 85-90 seconds. If you're going over 95s, you're talking too slow or adding asides.

5. Backup plans

If something breaks mid-recording, here's the recovery path for each failure:

What breaks	Recovery
Scout takes >60s	Stop the take, re-run the curl pre-warm in step 2, restart.

What breaks	Recovery
during the take	
Demand probe shows "___"	Check that <code>?key=Piglet</code> is still in <code>localStorage</code> (Application tab in devtools → Local Storage → look for <code>lts_demo_key</code>).
Niche Recon returns "no niches found"	Use the sample-mode URL: <code>https://longtailscout.com/?sample=1&q=roofing+contractors+in+Houston&key=Piglet</code> — runs deterministically from cache.
Live scout returns 0 operators	Switch to <code>?sample=1</code> mode for the recording. Mention it offhand or skip the comment entirely; the visuals are identical.
Map shows 0 of N geocoded	Skip the map view in the take. Stick with the table view.
Browser cleared the demo key	Re-open <code>https://longtailscout.com/?key=Piglet</code> .

6. Final pre-take sanity

Click the "Run scout" button on the home page **without recording**. Watch the trace fly by. You should see:

- Phase events: "discovery", "enrichment", "synthesis"
- A handful of "candidate" events with operator names
- The cost meter at the top ticking up to ~\$0.03

- A result table appearing with 8-10 ranked operators

If this preview-run works smoothly, you're ready. Hit record.
