

# LongTail Scout — Complete Feature Guide & Demo Walkthrough

---

This is the master reference for what the app can do. It lists every feature, where to find it, how to trigger it, and the one line to say about it. Use it to learn the surface, then follow the **Guided Walkthrough** at the bottom to demo. For the tight 90-second video narration, see `video-script.md` ; for pre-flight, `demo-checklist.md` .

**Version:** v1.7.2 · **Live:** <https://longtailscout.com> (unlock with `?key=Piglet` ) · **MCP:** 12 tools at `/api/mcp`

## The one-sentence pitch

---

Apollo / ZoomInfo / Clay are built on the LinkedIn graph, so they're blind to the 7M small, local, web-first operators (roofers, HVAC, dental, salons). LongTail Scout finds them via Bright Data + their own websites, **proves** they're invisible to Apollo, and hands an SDR everything to act: the person, the inbox, the "why now," and a ready-to-send brief.

The narrative spine for the whole demo: **find** → **prove** → **reach** → **act**.

## The wedge story (say this once, early)

---

"An SDR at AccuLynx or ServiceTitan needs net-new roofing or HVAC accounts. Apollo's data is database-thin for the long tail because these operators aren't on LinkedIn. LongTail Scout crawls their actual websites + Google + news in real time through Bright Data, and cross-references a private 7M-business demand index for market size."

## Feature inventory

---

### A. Discovery & the 3-phase pipeline

| Feature                                                         | Where / how                                                        | Say                                                                                                                                |
|-----------------------------------------------------------------|--------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Niche × city scout</b>                                       | Type roofing contractors in Houston , click <b>Run Scout</b>       | "Type a niche and city, the way an SDR scopes a list."                                                                             |
| <b>3-phase pipeline</b><br>(discovery → enrichment → synthesis) | The phase strip + live trace appear on run                         | "Discovery fires Bright Data SERP queries; enrichment renders each homepage + careers page; synthesis ranks and writes the angle." |
| <b>Live agent trace</b>                                         | Streams under the phase strip                                      | "Every step is streamed — this is the agent thinking out loud."                                                                    |
| <b>Live cost meter</b>                                          | Sticky at top during a run                                         | "Real spend — Bright Data renders + DeepSeek tokens. About 3 cents a scout."                                                       |
| <b>Multi-city expansion</b>                                     | Query a state: roofers in Texas → top-3 cities, globally re-ranked | "State-level queries fan out to the top metros and re-rank across all of them."                                                    |
| <b>Multi-niche</b>                                              | roofing OR HVAC contractors in Houston                             | "Compound queries split into multiple verticals."                                                                                  |
| <b>Sample mode (instant, free)</b>                              | Add ?sample=1 , or it auto-falls-back on error                     | "Cached 140 ms replay for a guaranteed-fast demo — identical event flow, zero spend."                                              |
| <b>25 vertical prompt packs</b>                                 | Auto-detected from the niche                                       | "25 verticals each inject the right buyer names and ICP hints."                                                                    |

## B. Results table

| Feature                               | Where                                                             | Say                                                                            |
|---------------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------------------|
| Ranked operators + confidence (0-100) | Main table                                                        | "Rank answers 'who first'; confidence answers 'how much do I trust this row'." |
| Apollo-thin badge                     | Per row                                                           | "Operators on their own site, not LinkedIn — the long tail."                   |
| Citations / footnotes                 | Drill-down → footnotes                                            | "Every claim links back to the exact Bright Data fetch. No hallucination."     |
| Filter + sort                         | Min-confidence slider, hiring-only, long-tail-only; click headers | "Filter to hiring-only or the smallest operators."                             |
| CSV export + copy                     | Toolbar                                                           | "One click into Apollo / HubSpot / Salesforce."                                |
| Wedge summary banner                  | Above table                                                       | "Quantifies the Apollo gap for this run."                                      |
| Per-city breakdown                    | Bar chart on multi-city runs                                      | —                                                                              |

### C. Map & demand density

| Feature           | Where            | Say                                                                                                                                                                                             |
|-------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Map view          | Toggle Table/Map | "Every operator geocoded and pinned."                                                                                                                                                           |
| Heat-map underlay | Under the pins   | "Colored circles are the whole niche from the 7M-record index — color = rating, radius = review count. Density Apollo can't show." (v1.7.2: pulls a deep page so the map is dense, not sparse.) |

| Feature      | Where                             | Say                                                                                                     |
|--------------|-----------------------------------|---------------------------------------------------------------------------------------------------------|
| Demand probe | Under the query input as you type | "The moment you type a niche, it shows how many businesses match in the 7M index — 82,000 for roofing." |

## D. Per-operator drill-down — the intelligence suite (click any row)

This is the richest part and where the newest features live. **Open row #1 and walk down the panel.** | Feature | Trigger | Say | BD tie-in | |---|---|---|---| | **Apollo-blind verification** (v1.2) | Auto-fires on open | "We search LinkedIn through Bright Data — *confirmed not on LinkedIn*. That's exactly why Apollo can't see them." | Live `site:linkedin.com/company` via BD | | **Homepage screenshot** | Auto, lazy | "Rendered live by the Bright Data Browser, cached 30 days." | BD Browser render | | **Contact discovery** (v1.3) | Click **find via Bright Data** | "Walks the contact/about pages and pulls a real inbox, phone, and named contact." | BD multi-page render | | **Decision-maker finder** (v1.7) | Click **find via Bright Data** | "Finds the owner/founder and their LinkedIn profile — who, specifically, to contact." | Live `site:linkedin.com/in` via BD | | **Signal radar** (v1.6) | Click **scan news via Bright Data** | "Live third-party news — funding, a new location, an award — the timeliest 'why now'." | Live news SERP via BD | | **AI cold email** | Click 🌟 + AI | "DeepSeek writes a personalized email from the operator's own about + hiring. ~2 hundredths of a cent." | DeepSeek | | **Export brief** (v1.4) | Click **export brief** | "One Markdown dossier — evidence, contacts, draft email, every Bright Data source. Paste into a CRM." | — | | **Lookalikes** | Click **scan memory** | "Operators with overlapping query history — same-buyer signal." | KV memory | | **Tech stack** | Shown if detected | "Sniffed from the homepage HTML — what vendors they already run." | — | | **SDR notes / print dossier** | In-panel | "Private scratchpad; print to PDF." | — |

## E. "Act first" trigger feed (v1.5)

| Feature               | Where           | Say                                                                                                         |
|-----------------------|-----------------|-------------------------------------------------------------------------------------------------------------|
| Trigger-event ranking | Panel above the | "Re-ranks the run by buying-signal strength — open roles, expansion, funding — so the SDR knows who to call |

| Feature | Where             | Say                                                                     |
|---------|-------------------|-------------------------------------------------------------------------|
|         | table after a run | <i>first</i> . Zero extra spend; scored from what we already gathered." |

## F. Niche Recon — reverse the funnel (the killer move)

| Feature             | Where                                           | Say                                                                                                                                                     |
|---------------------|-------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product → verticals | "🌀 don't know your niche?" chip above the input | "Paste what you sell. We map it to verticals, then rank by demand-density × Apollo-thinness — what share of operators have no domain Apollo can match." |

## G. Watchlist & automation

| Feature               | Where                | Say                                                                                         |
|-----------------------|----------------------|---------------------------------------------------------------------------------------------|
| Watchlist             | Save a query         | "Server-side saved queries with new-vs-seen tracking."                                      |
| Daily cron refresh    | Automatic 13:00 UTC  | "Refreshes demand counts daily — '+N businesses since yesterday' without paying per scout." |
| Email digest          | Subscribe to a watch | "CAN-SPAM-compliant digest with a signed unsubscribe link."                                 |
| Slack/Discord webhook | Watch settings       | "Pings a channel when new operators land."                                                  |

## H. MCP server — 12 tools

| Feature      | Where                                             | Say                                                                |
|--------------|---------------------------------------------------|--------------------------------------------------------------------|
| MCP endpoint | <code>/api/mcp</code> , docs at <code>/mcp</code> | "Every capability is also an MCP tool — drive the whole thing from |

| Feature  | Where                                                                                                                                                                          | Say                                                                                                       |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
|          |                                                                                                                                                                                | Claude Desktop or Cursor."                                                                                |
| 12 tools | scout, find_businesses, demand_count, operator_screenshot, draft_email, niche_recon, linkedin_check, find_contacts, account_brief, rank_triggers, signal_radar, decision_maker | "Find an operator, verify it's Apollo-blind, find the person, draft the email — all from your assistant." |

## I. UX, sharing, trust

Voice input · keyboard shortcuts (⌘/Ctrl+Enter run, ⌘/Ctrl+K focus) · one-click vertical demo chips · saved queries · shareable URLs ( ?q=...&run=1 ) · per-operator permalinks ( ?op=... ) · social-share snippets · OG cards ( /share ) · first-visit onboarding · BYOK panel (paste your own DeepSeek key) · Apollo-vs-LongTail compare panel · /about (how it works) · /docs (API reference) · /mcp (MCP guide).

## Guided walkthrough — extended cut (~3–4 min, shows the new features)

Use the 90-second `video-script.md` for the submission video. Use **this** longer flow for a live judge Q&A or a deeper recording, because it surfaces the v1.2–1.7 intelligence the short script skips.

1. **Hook (15s)**. Land on the page. "Apollo can't see 7 million small American businesses because they're not on LinkedIn. LongTail Scout finds them — and proves it."
2. **Run a scout (40s)**. `roofing contractors in Houston` → Run. Narrate the 3 phases + cost meter. (Pre-warmed → returns fast.)
3. **Results (20s)**. Point at confidence, Apollo-thin badges, the wedge banner. Mention CSV export.
4. **"Act first" feed (15s)**. "Before drilling in — the feed already tells me who to call first, ranked by live buying signals."

5. **Drill-down — the money sequence (70s).** Open row #1 and go top-to-bottom:
  - **Apollo-blind verification** badge → "Confirmed not on LinkedIn, via Bright Data. *This is the thesis, proven live.*"
  - **find via Bright Data** (contacts) → real email + phone.
  - **decision-maker** → "And here's the owner, with his LinkedIn — who to actually email."
  - **scan news via Bright Data** (signal radar) → any funding/expansion headline.
  - ✨ + **AI** → DeepSeek email referencing a real fact.
  - **export brief** → download the Markdown dossier. "Everything an SDR needs, one click, every claim cited."
6. **Map (15s).** Toggle to Map → dense heat-map. "The whole niche, not just my picks."
7. **Niche Recon (30s).** Reverse the funnel: paste a product description → top verticals by Apollo-thinness.
8. **MCP (15s).** Show /mcp → "All 12 of these are MCP tools — run it from Claude Desktop."
9. **Close (10s).** "longtailscout.com. Bright Data + DeepSeek under the hood. Thanks."

**Sequence to emphasize for judges:** *find* → *prove* (*Apollo-blind*) → *reach* (*contact* + *decision-maker*) → *why-now* (*signal radar*) → *act* (*brief*). No competitor does the "prove" or "reach the person" steps.

## Demo modes & fallbacks

---

- **Fastest / safest:** <https://longtailscout.com/?key=Piglet> then use the **vertical demo chips** (each has cached sample data) or append `?sample=1` . Instant, free, deterministic.
- **Live (impressive, costs ~\$0.03 + a few cents for the drill-down BD calls):** plain scout, no `?sample` . Requires the **bridge** running on the home server for the BD features.
- **If the bridge is down:** scout, triggers, brief, niche-recon, demand probe still work. The four drill-down BD features (Apollo-blind, contacts,

decision-maker, signal radar) show a graceful "unavailable" message — skip them in the take, or start the bridge first ( `demo-checklist.md` ).

- **Bridge health:** `curl -s https://bridge.longtailscout.com/health` should return `{"ok":true,...}` .
